

Marks — the coding sheet (points-de-fuite · C-futon1b-features)

Declare, don't guess: a mark punctuates the judged thing, at the moment of judging. Lowercase key = bare glyph · UPPERCASE = long form (✕ :ref TARGET "why") with point at the ref.

CORE TIER — c-c . (these carry weight: γ events; ✓/✕ mint labels)

KEY	NAME	USE IT WHEN...	FEEDS
✕	x / X correction	the agent's claim, plan, or artifact is wrong — push back	γ(mission)↓ · label <i>success=false</i> when :ref'd to a deposit
✓	v / V approval	a delivered artifact is right — accept it	γ(mission)↑ · label <i>success=true</i> when :ref'd to a deposit
💡	i / I idea-to-explore	"here's an idea that shouldn't be hard to try"	mint queue · reflection (never a label)

SECOND STRING — c-c , (shadow tier: tags only — usage argues promotion)

KEY	NAME	USE IT WHEN...
⚖	h / H hinge	a genuine decision point — things could swing either way (<i>rare; each one is precious — the reflection lane indexes these</i>)
⚠	c / C concern	early warning — a correction before the mistake completes
🧭	g / G guidance	steering: orientation, direction-setting (not a specific fix)
👤	t / T tactics	the concrete move: do X then Y
📌	f / F fact	pinning down a fact the record should hold onto
👏	e / E encouragement	applause for effort/direction — warmer than ✓, no label weight (keeps ✓ crisp)
🙏	r / R request	an explicit ask
🌿	x / X extension	a branch off existing work
📋	p / P procedural	process/checklist register

THE TWO HONEST TARGETS (? in a hydra = live tally)

- 20 ref-bearing ✓/✕ on fold-deposits → unlocks the **L3 measurement gate** (does the operator channel beat the fold mint?)
- 5 ✓/✕ per clocked mission → that mission's **γ leaves the uniform prior** (R14 burn-in)

Second-string types have **counts, no targets** — no threshold was declared, so none is invented. Usage argues promotion.

RULES OF THE NOTATION

- Use vs mention.** A mark *punctuating* your statement is an event; a mark inside a description of the convention ("...with a ✕, for example") is a mention and mints nothing.
- The high-value keystroke** is UPPERCASE ✓/✕ on agent work: (✓ :ref ft-... "...") — the :ref is what turns a judgment into a reward label.
- Impact order** when in doubt: ✓/✕ with :ref > bare ✓/✕ on mission work > ⚖ > ⚠ > 💡 > the rest.
